

The Swiss based steel wire rope company Verope says it has great news for wire rope users in the construction industry, with the launch of Verotop XP, a rotation resistant, swaged version of the Verope bestseller Vero-top P.

Verotop XP has a very high breaking strength and excellent bending fatigue characteristics, the company says.

The new swaged 16 strand rope consists of 35 strands and 229 wires. Having such a large number of elements makes the rope extremely flexible, Verope says.

The swaging of the outer strand layer, providing a smooth wire rope surface, offers increased resistance against drum crushing in applications with multiple layer spooling.

The company said that the swaged rope's performance characteristics have been proven by testing in the field bending fatigue tests.

Verotop XP provided superior performance compared with non-swaged rope designs in field trials on drilling and pile driving equipment, the company said.

It is now available to buy on the international market.
